

Reflection of Diana Simonicova

- **Challenges:** First challenge was to set up our Git repository and work well without overwriting our codes. We had difficulties at the beginning with merging, but after one day we figured out and could work well even remote. Another issue was when I wanted to implement colour indication for swapping direction, that user can have clear affordance about which side is correct answer and which is false, unfortunately we could not implement that component to be that complex, but we manage to add nice animation while swapping to make the user experience smooth.
 - **Contribution:** We worked with Tijana very well together, we split the work everyday and we informed each other about the state. I took care of the design and usability testing and she was making the app working from code perspective.
 - **Final app:** we did pretty much of re-design and improve the app, but it still meets the core of the initial concept.
 - **Improvements:** there is always space for improvements. If we continued development, we would focus on improving performance, usability, and adding advanced learning features
